I am sure many people would still prefer to describe the new features themselves. According to Adobe, the new features of Photoshop are: "In the new filmstrip/photo viewer Improved color workflows Revamped creative tools Brilliant improvements to the entire Photoshop experience Access to the Adobe Exchange Your chance to get even more creative." Of course it's a great deal. But it is too easy to be mentioned in a review. Let's show these new features and see how they all work in the real world. Both Photoshop and Lightroom are known for being chock full of features, and that's no secret. That said, it can be hard to decide which features to use and which to leave behind, especially when software is constantly being updated with new features. But in those instances when you really do want to make the most of those features and they're not already built into the program, you can find work-arounds. In my experience, I found that you can get surprisingly far with limited resources. And if I really want to do more, I tend to go back to Photoshop's ability to open and edit RAW images, which provides even more power and customization. My final recommendation to anyone who may be considering switching from Lightroom would be to use the trial version first. This will limit you to only being able to work on a pre-made catalog that will ultimately be removed from your hard drive. And yet, you will gain an excellent idea of how the program performs in your workflow. If you decide to purchase the full version, you can simply and easily transfer the catalog to a new drive or partition. Just like an actual catalog, Lightroom is only as good as your notes, so make sure you have a bunch of them!
